K & ::= & \mathsf{coe}_{\square}^{r \rightsquigarrow r'}(M) \mid \ldots & \text{(continuations)} \\
C & ::= & M \triangleleft \mathcal{E} & \text{(closures)} \\
\mathcal{E} & ::= & (\mathbb{\vartheta}, \gamma, \psi) & \text{(environments)} \\
\mathbb{\vartheta} & ::= & \overline{\mathbb{x} \hookrightarrow \Psi.M \triangleleft \mathcal{E}} & \text{(meta env.)} \\
\gamma & ::= & \overline{a \hookrightarrow C} & \text{(object env.)} \\
\psi & ::= & \overline{x \hookrightarrow r} & \text{(dimension env.)} \\
f & ::= & (K, \mathcal{E}, \Psi) & \text{(frames)} \\
\pi & ::= & \cdot \mid f :: \pi & \text{(stacks)} \\
\mathcal{C} & ::= & \langle M \triangleleft \mathcal{E} \parallel \pi \rangle & \text{(states)}
\end{array}
$$

We will write $M[\mathcal{E}]$ for substituting the free dimensions and variables of a term M using an environment $\mathcal{E}$.

Stack frames and machine states A stack frame $(\ K, \mathcal{E}, \Psi\ )$ represents a continuation whose whole binds Ψ dimensions. For a stack π, let $\vec{\Psi}$ be the aggregation of all the dimension bindings Ψ mentioned in π; then the extension of a stack $(K, \mathcal{E}, \Phi) :: \pi$ is wellformed when $\mathcal{E}$ is an environment for $\mathbf{FD}(K) \setminus \vec{\Psi}$; moreover, K is allowed to mention the dimensions in $\vec{\Psi}$.

A machine state $\langle M \triangleleft \mathcal{E} \parallel \pi \rangle$, where $\vec{\Psi}$ is the aggregation of dimension bindings in π, is wellformed when $\mathcal{E}$ is an environment for $\mathbf{FD}(M) \setminus \vec{\Psi}$; moreover, M is allowed to mention the dimensions in $\vec{\Psi}$.

Selected transition rules We define a transition judgment $\mathcal{C} \succ_{\mu} \mathcal{C}'$ with μ ranging over the following possible modes:

1. $\cube$, denoting a cubically stable transition
2. $\bullet$, denoting a non-cubically stable transition

Moreover, if $\mathcal{C} \succ_{\cube} \mathcal{C}'$ then $\mathcal{C} \succ_{\bullet} \mathcal{C}'$.

$$\langle a \triangleleft (\gamma, \psi) \parallel \pi \rangle \succ_{\cube} \langle \gamma(a) \triangleleft (\gamma, \psi) \parallel \pi \rangle \tag{1}$$

$$\left\langle M(N) \triangleleft \mathcal{E} \parallel \pi \right\rangle \succ_{\cube} \left\langle M \triangleleft \mathcal{E} \,\middle\|\, (\square(N), \mathcal{E}, []) :: \pi \right\rangle \tag{2}$$

$$\left\langle \lambda a.M \triangleleft \mathcal{E} \,\middle\|\, (\square(N), \mathcal{E}', []) :: \pi \right\rangle \succ_{\cube} \langle M \triangleleft [\mathcal{E}, a \hookrightarrow N \triangleleft \mathcal{E}] \parallel \pi \rangle \tag{3}$$

$$\langle \mathsf{fst}(M) \triangleleft \mathcal{E} \parallel \pi \rangle \succ_{\cube} \left\langle M \triangleleft \mathcal{E} \,\middle\|\, (\mathsf{fst}(\square), \mathcal{E}, []) :: \pi \right\rangle \tag{4}$$

$$\langle \mathsf{snd}(M) \triangleleft \mathcal{E} \parallel \pi \rangle \succ_{\cube} \left\langle M \triangleleft \mathcal{E} \,\middle\|\, (\mathsf{snd}(\square), \mathcal{E}, []) :: \pi \right\rangle \tag{5}$$

$$\left\langle \langle M, N \rangle \triangleleft \mathcal{E} \,\middle\|\, (\mathsf{fst}(\square), \mathcal{E}', []) :: \pi \right\rangle \succ_{\cube} \langle M \triangleleft \mathcal{E} \parallel \pi \rangle \tag{6}$$

$$\left\langle \langle M, N \rangle \triangleleft \mathcal{E} \,\middle\|\, (\mathsf{snd}(\square), \mathcal{E}', []) :: \pi \right\rangle \succ_{\cube} \langle N \triangleleft \mathcal{E} \parallel \pi \rangle \tag{7}$$

$$\langle \mathsf{loop}_r \lhd (\gamma, \psi) \parallel \pi \rangle \succ_{\square} \langle \mathsf{base} \lhd (\gamma, \psi) \parallel \pi \rangle \textbf{ when } r\psi = \epsilon \tag{8}$$

$$\tag{9}$$

$$\langle \mathsf{coe}_{x.A}^{r \rightsquigarrow r'}(M) \lhd \mathcal{E} \parallel \pi \rangle \succ_{\square} \left\langle A \lhd \mathcal{E} \,\middle\|\, (\mathsf{coe}_{\square}^{r \rightsquigarrow r'}(M), \mathcal{E}', [x]) :: \pi \right\rangle \tag{10}$$

$$\left\langle \mathsf{bool} \lhd \mathcal{E} \,\middle\|\, (\mathsf{coe}_{\square}^{r \rightsquigarrow r'}(M), \mathcal{E}', [x]) :: \pi \right\rangle \succ_{\square} \langle M \lhd \mathcal{E}' \parallel \pi \rangle \tag{11}$$

$$\begin{gathered} \left\langle (a : A) \times B \lhd \mathcal{E} \,\middle\|\, (\mathsf{coe}_{\square}^{r \rightsquigarrow r'}(M), \mathcal{E}', [x]) :: \pi \right\rangle \\ \succ_{\square} \\ \left\langle \langle \mathsf{coe}_{x.\mathbbm{x}[x]}^{r \rightsquigarrow r'}(\mathsf{fst}(M)), \mathsf{coe}_{x.\mathbbm{y}[x]}^{r \rightsquigarrow r'}(\mathsf{snd}(M)) \rangle \lhd \mathcal{E}', \mathbbm{x} \hookrightarrow x.A \lhd \mathcal{E}, \mathbbm{y} \hookrightarrow x.B \lhd [\mathcal{E}, a \hookrightarrow \mathsf{coe}_{y.\mathbbm{x}[y]}^{r \rightsquigarrow x}(\mathsf{snd}(M)) \lhd [\mathcal{E}, \mathbbm{x} \hookrightarrow x.A \lhd \mathcal{E}]] \,\middle\|\, \pi \right\rangle \end{gathered}$$

Unloading the machine We can unload the machine at any time; this is useful if we are computing an open term and hit a variable.

$$\frac{}{\langle M \lhd \mathcal{E} \parallel \cdot \rangle \Longrightarrow M[\mathcal{E}]} \qquad \frac{\langle K[\Psi.M[\mathcal{E}]] \lhd \mathcal{E}' \parallel \pi \rangle \Longrightarrow N}{\left\langle M \lhd \mathcal{E} \,\middle\|\, (K[\square], \mathcal{E}', \Psi) :: \pi \right\rangle \Longrightarrow N}$$
